

Artificial Intelligence and Machine Learning

Machine learning is a branch of artificial intelligence that enables computers to learn patterns from data.

Supervised learning uses labeled data to train machine learning models.

Unsupervised learning works with unlabeled data and discovers hidden patterns in datasets.

Deep learning uses neural networks with multiple layers.

Natural language processing allows computers to process and understand human language.

Computer vision enables computers to analyze images and videos.

Vector databases store numerical representations called embeddings. These embeddings allow semantic search over documents.

Retrieval augmented generation retrieves relevant information from documents and provides the information to a language model.

Ollama allows large language models to run locally on a computer.
